Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of the claims in the application:

Listing of Claims:

1. (Original) A method, comprising:

using credential information stored in a subscriber identity module (SIM) associated with a General Packet Radio Service (GPRS) adapter to authenticate access to a wireless local area network (WLAN), wherein communications with the SIM is carried out using extensible authentication protocol (EAP).

- 2. (Original) The method of claim 1, further comprising issuing one or more requests via a smart card interface to get the credential information.
- 3. (Original) The method of claim 2, further comprising: arbitrating the one or more requests to the SIM when the SIM is busy.
- 4. (Original) The method of claim 3, wherein the one or more requests are received by the SIM via a SIM reader driver.
- 5. (Original) The method of claim 4, further comprising: receiving the credential information from the SIM after the one or more requests are processed by the SIM.
- 6. (Original) The method of claim 1, further comprising:

establishing a WLAN connection with the WLAN via a WLAN adapter.

- 7. (Original) The method of claim 6, wherein the WLAN connection is established while there is a connection to a GPRS network via the GPRS adapter.
- (Original) The method of claim 7, further comprising:
 issuing a location update to switch data services from the GPRS network to the WLAN; and

disconnecting from the GPRS network.

- 9. (currently amended) A machine computer-readable medium including machine readable instructions that, if executed by a computer system, cause the computer system to perform a method comprising:
- using credential information stored in a subscriber identity module (SIM) associated with a General Packet Radio Service (GPRS) adapter to authenticate access to a wireless local area network (WLAN), wherein communications with the SIM is carried out using extensible authentication protocol (EAP).
- 10. (currently amended) The machine computer -readable medium of claim 9, further comprising

issuing one or more requests via a smart card interface to get the credential information.

11. (currently amended) The machine computer -readable medium of claim 10, further comprising: arbitrating the one or more requests to the SIM when the SIM is busy.

- 12. (currently amended) The machine computer -readable medium of claim 11, wherein the one or more requests are received by the SIM via a SIM reader driver.
- 13. (currently amended) The machine computer -readable medium of claim 12, further comprising:

receiving the credential information from the SIM after the one or more requests are processed by the SIM.

- 14. (currently amended) The machine computer -readable medium of claim 9, further comprising: establishing a WLAN connection with the WLAN via a WLAN adapter.
- 15. (currently amended) The machine computer -readable medium of claim 14, wherein the WLAN connection is established while there is a connection to a GPRS network via the GPRS adapter.
- 16. (currently amended) The machine computer -readable medium of claim 15, further comprising:

issuing a location update to switch data services from the GPRS network to the

WLAN; and

disconnecting from the GPRS network.

17. (Original) A system, comprising:

a wireless local area network (WLAN) adapter;

- a general packet radio service (GPRS) adapter coupled to the WLAN adapter and including a subscriber identify module (SIM); and
- a mobility client to initiate requests for credential information from the SIM to authenticate access to a WLAN when the mobility recognizes an access point, wherein said requests for the credential information are communicated to the SIM using extensible authentication protocol (EAP).
- 18. (Original) The system of claim 17, wherein the requests for the credential information are communicated to the SIM via a smart card interface.
- 19. (Original) The system of claim 18, wherein the requests for the credential information are received by the SIM via a SIM reader driver.
- 20. (Original) The system of claim 19, wherein the GPRS adapter includes a SIM access module (SAM) to arbitrate the request for the credential information to the SIM.
- 21. (Original) The system of claim 20, wherein the SAM arbitrates the requests for the credential information to the SIM while there is a GPRS connection to a GPRS network via the GPRS adapter.
- 22. (Original) The system of claim 21, wherein the mobility client is further to issue a location update after the access to the WLAN is authenticated and a WLAN connection is established.

- 23. (Original) The system of claim 22, wherein the mobility client is further to drop the GPRS connection.
- 24. (Canceled)
- 25. (Original) The system of claim 17, wherein the WLAN adapter and the GPRS adapter are installed an open platform.
- 26. (Original) The system of claim 17, wherein the WLAN adapter and the GPRS adapter are combined into one module.
- 27. (Original) A system, comprising:

means for initiating requests for credential information from a subscriber identity module (SIM) associated with a general packet radio service (GPRS) adapter;

means for authenticating access to a wireless local area network (WLAN) using the credential information; and

means for switching data services from a GPRS connection to a WLAN connection after the access to the WLAN is authenticated.

- 28. (Original) The system of claim 27, wherein said means for requesting the credential information from the SIM includes means for arbitrating requests to the SIM.
- 29. (Original) The system of claim 28, wherein said means for switching data services between the GPRS connection and the WLAN connection includes means for performing a location update.

30. (Original) The system of claim 27, further comprising: means for interfacing with the SIM to send the request for the credential information.
